BrandGuard — Submission Evidence Brief

Team: VIT REPRESENT · **Lead:** YASH S
Repository: github.com/yashkatariya21/brandgaurd

BrandGuard is a governance prototype for versioned facts and rules. It checks registered content for potential problems and helps reviewers record decisions. It does not publish or change content automatically. Demo data is fictional.

Promised vs. delivered

Area	Implemented	Honest boundary
Blast Radius	Version comparison, Confirmed/Possible results, graph paths and registered-state prioritisation.	Registered content only. Graph paths do not prove staleness or publication. Similarity is uncalibrated; optional pgvector is off and requires supplied vectors. No embedding generation or document-vector search.
Red Team	Four perspectives, checked references, grouping, stability filtering and human decisions.	Hosted calls are disabled until a monetary cap exists. Demo heuristics are not AI; repeat demo results do not measure reliability. Citations do not prove conclusions.
Chaos Testing	Candidate contradictions and gaps, review cases for rule families, saved labels and comparisons, checker regression for selected rules.	No full automated checker for all families. Heuristic agreement is not correctness; human labels are judgments.
Governance	Versioned records, approval workflows, database isolation mechanisms, audit and human decisions.	Deployed role/RLS and browser flow require verification. No legal advice or automatic publication.

Includes unmerged branch changes; not proof of deployment.

Verification and demo

Verifiable engineering evidence

• GitHub Actions run 43367031731 passed at commit **7855164e820ee89ee865a588f561a5b93c5d1fbf**: PostgreSQL/pgvector, migrations, seed, backend tests and the no-skips guard; frontend lint and build passed. This is not evidence for later commits or production.

• Current branch local checks: **145 passed, 45 skipped** on Python 3.11; frontend lint and build passed. Skips include database-backed tests. Independent QA and current-branch DB CI remain outstanding.

• Runtime is **demo/heuristic**, not live hosted AI. The provider stop is a spend-safety measure, not an implemented monetary cap. No live AI rehearsal or accuracy claim is made.

Hosting and demo

Backend configuration targets Render at https://brandgaurd-ibin.onrender.com; frontend configuration targets Vercel. A current live-browser check, CORS, database runtime permissions and the frontend URL have not been independently verified in this session. Check /health immediately before the demo and use the team’s confirmed frontend URL.

Suggested walk-through: submit and approve a fact change using distinct roles; scan registered content; review a Possible finding and its sources; create and label rule-test cases. Report actual on-screen results.

Do not claim that all content was scanned, citations prove arguments, demo repetitions establish reliability, or the product gives legal advice.

Detailed records: docs/QA-report.md, docs/proposal-verification.md and docs/disclosure.md.
